Contents

1   Introduction

2   Analysis

As mentioned in the Introduction, this report presents the attempt to build a machine learning model to classify Tweets in a binary model. In this particular case, the question to answer is whether those tweets correspond to a catastrophic event or not. The idea for this was taken of a Kaggle Competition for Starters (Real or Not? NLP with Disaster Tweets). Instead of using the data provided in Kaggle, in this report the original version in Data For Everyone is used.
